CLITIC DOUBLING AND DIFFERENTIAL OBJECT MARKING IN NON-SPECIFIC CONTEXTS IN ROMANIAN[1]

KLAUS VON HEUSINGER[2], ALINA TIGĂU[3]

Abstract. This paper provides empirical insights into the semantic import of the Differential Object Marker *pe* (DOM) and of accusative pronominal clitics (CD) as specificity triggers with indefinite direct objects (DOs) in Romanian. The experiment we discuss investigates the behaviour of unmarked and marked DOs when occurring in various contexts forcing a non-specific reading. We compared two types of marked DOs: single differentially marked DPs (DOMed DOs) and clitic-doubled and differentially-marked ones (CDed+DOMed DOs). First inspection shows that, even though marking seems to render the DO a less suitable candidate for non-specific contexts, items containing marked DOs are not actually excluded as unacceptable. Closer inspections reveal, however, that the variation of acceptability judgements can be divided into more homogenous groups of speakers with a distinctive behaviour. Some groups do not accept marked DOs in the non-specific contexts, while others accept both marked and unmarked DOs. This observation leads us to assume that we see a diachronic development of the function of CD and DOM from a marker of specificity towards a marker of true argumenthood of the DO. The paper also contributes to the syntactic analysis of CD and DOM as part of the general layout of the DP.

Keywords: specificity, Differential Object Marking, Clitic Doubling, direct object, indefinites

1. Introduction

Romanian Clitic Doubling of accusative DPs is characterized by the interdependence between a pronominal clitic doubling the DO and DOM as in (1a-c). Unmarked indefinites in direct object position, (1a), can receive a specific, i.e., wide scope, reading or a non-specific, i.e., narrow scope, reading. CDed+DOMed indefinites, (1c), have been claimed to lose the non-specific interpretation available for their unmarked counterparts (Niculescu 1965, Farkas 1987, Dobrovie-Sorin 1990, Pană Dindelegan 1997, Cornilescu 2000, Chiriacescu & von Heusinger 2010: 303):

(1)   a.   Toţi   bărbaţii   iubesc   o   femeie
              All   men   love   a   woman
              'All men love a woman.' (specific/non-specific)

       b.   Toţi   bărbaţii   iubesc   **pe**   o   femeie
              All   men   love   DOM   a   woman
              'All men love a woman.' (only specific)

	c.	Toţi	bărbaţii	**o**		iubesc	**pe**	o	femeie
		All	men	CL.3.SG.FEM.ACC		love	DOM	a	woman

'All men love a woman.' (only specific)

A similar claim has been put forth for single DOMed DOs, i.e., DOs which have been *pe*-marked but left undoubled, (1b). Thus, both DOMed and DOM+CDed DOs have been argued to bear a specific reading but the literature does not agree on the exact source of specificity. Farkas (1987), Dobrovie-Sorin (1990, 1994), and Cornilescu (2000) argue, for instance, that DOM is accountable for the specific reading, while Steriade (1980) and Gierling (1997) argue in favour of a correlation between specificity and clitic doubling. Lastly, von Heusinger and Onea (2008), Chiriacescu and von Heusinger (2010) and Tigău (2011) see specificity as a joint effect of DOM and CD.

Nevertheless, (less frequent, still natural) examples with DOM but without CD allow the hypothesis that single DOMed DOs behave on a par with their unmarked counterparts, allowing both for a specific as well as for a non-specific interpretation (with a propensity for the former reading). The presence of CD, on the other hand, seems to strongly tilt the balance towards a specific interpretation. Consider (2a-b) where (2a) only allows for a narrow scope reading of *un singur profesor* 'a single professor', which can be expressed with or without DOM. When adding CD to the DOMed version, the sentence becomes pragmatically unacceptable given that the CD forces a specific reading, which is not felicitous in this context.

(2)	a.	N-am		văzut	**(pe)**	un		singur	profesor
		Not-have.1.SG		seen	DOM	a		single	professor

în	toată	viaţa		mea		care	să	se	poarte	aşa
in	all	life.the		mine.FEM.SG.		who	SUBJ	REFL	behave	so

urât	cu	studenţii	cum	o	face	el
ugly	with	students	how	it	does	he

'I haven't seen a single professor in my whole life who would behave so badly with the students as he does.'

	b.	?Nu	**l**-am		văzut	**pe**	un		singur
		Not	CL.3.SG.M.ACC-have.1.SG		seen	DOM	a		Single

profesor		în	toată	viaţa		mea		care	să	se
professor		in	all	life.DEF.ART.		mine.FEM.SG.		who	SUBJ	REFL

poarte	aşa	urât	cu	studenţii	cum	o	face	el
behave	so	ugly	with	students	how	it	does	he

'I haven't seen a single professor in my whole life who should behave so badly with the students as he does.'

Another context strengthening the hypothesis that the pronominal clitic induces specificity is that of left-dislocated DOs, which come in two constructions: In one

construction the DO is simply moved to the left periphery without being resumed by a pronominal clitic, while in the other construction the left-dislocated DO is also clitic-resumed. In the latter construction the direct object must be interpreted specifically, as is illustrated by its incompatibility with the distributivity marker *câte* forcing a non-specific interpretation. We illustrate this with inanimate direct objects, which do not take the differential object marker *pe* and therefore show the sole effect of clitic doubling.

In (3a), the left dislocated DO *două cărţi* ('two books') may be read either specifically or non-specifically. In (3b), where the DO has also been clitic-resumed, only the specific interpretation seems to be available (i.e., one in which every student read the same two specific books written by Tolstoy). Since this specificity restriction seems to arise as a consequence of clitic resumption (in the absence of DOM), one might presuppose that the clitic alone is at the core of the specific interpretation (while DOM serves a different purpose). The hypothesis is further strengthened when considering the combination of these constructions with the distributive marker *câte* in (4a) and (4b): while the undoubled DO allows co-occurrence with *câte* exhibiting a non-specific reading, the CLLDed variant does not fare very well in this respect, showing that this construction only allows a specific and wide scope reading.

(3)   a.   Două   cărţi   de Tolstoi   a   citit   fiecare   student
           Two   books   by Tolstoy   has   read   every   student
           'Every student has read two books by Tolstoy.'

   b.   Două   cărţi   de Tolstoi   **le-**a   citit   fiecare   student
        Two   books   by Tolstoy   CL.3.PL.ACC-has   read   every   student
        'Every student has read two books by Tolstoy.'

(4) a.   *Câte*   două   cărţi   de Tolstoi   a   citit   fiecare   student
         CATE   two   books   by Tolstoy   has   read   every   student
         'Every student has read two books by Tolstoy.'

   b.   *?Câte*   două   cărţi   de Tolstoi   **le-**a   citit   fiecare
        CATE   two   books   by Tolstoy   CL.3.PL.ACC-has   read   every

student
student
'Every student has read two books by Tolstoy.'

It seems then that CLLDed indefinite DOs have a specific reading even in the absence of DOM. Unmarked left-dislocated DOs behave on a par with their unmoved counterparts. This state of affairs lends strong support to the hypothesis that the pronominal

clitic (and not DOM) is the actual trigger for specific readings,[4] which was accepted as one of the hypotheses put forth for the current experiment.

From the observations above, we can formulate the following three hypotheses: Firstly, unmarked DOs may read both specifically as well as non-specifically and the latter reading obtains easily in contexts inducing a non-specific interpretation. Secondly, DOMed DOs pattern with unmarked DOs allowing for a non-specific reading in the appropriate contexts. Thirdly, CDed+DOMed DOs strongly favour a specific interpretation and will be discarded as ungrammatical when inserted in contexts forcing a non-specific reading.

In order to verify these hypotheses, we have tested the behaviour of unmarked and marked DOs (single DOMed DOs and CDed+DOMed+CDed DOs) when occurring in various contexts inducing a non-specific reading. The contexts contained the following expressions: the quantifiers *cel mult* ('at most')/*cel puțin* ('at least'*)*, the distributive *câte*, the free choice indefinite *oarecare* ('any'), and relative clauses modifying the indefinite DO and containing a predicate in the *subjunctive mood*.[5]

The structure of the paper is as follows: section 2 is a very brief overview of the basic facts of Romanian DOM as a mechanism triggering a specific interpretation. Section 3 presents the testing contexts we employed in the experiment together with the predictions regarding the behaviour of the three DO types. Section 4 describes the experiment proper, focusing on its design, the method employed and the results we obtained. Section 5 amounts to a more extensive discussion of the results in view of the initial hypotheses. Finally, section 6 contains the conclusions to this paper.

2. Specificity and DOM

Romanian may mark its direct objects by means of a differential object marker, the functional counterpart of the locative preposition *pe* ('on'), as well as by means of a pronominal clitic in the accusative. The latter phenomenon, known as clitic doubling, may only affect differentially object-marked (DOMed) DOs as shown in (5c) vs. (5d). Thus, DOs may be left unmarked (5a), or may bear either the marker *pe* (5b) or both *pe* and an accusative clitic (5c):

(5) a. Am   văzut câțiva   studenți învățând pentru examen
         Have.1.SG   seen   some   students studying for   exam
         'I saw some students studying for the exam.'

     b. Am   văzut **pe**   câțiva   studenți învățând pentru examen
         Have.I   seen   DOM   some   students studying for   exam
         'I saw some students studying for the exam.'

     c. **I**-am   văzut **pe**   câțiva   studenți învățând
         CL.3.PL.ACC-have.I seen   DOM   some   students studying
         'I saw some students studying.'

---

[4] Building on the case of CLLDed and (non-DOMed) indefinites, Tigău (2016) analyses the pronominal clitic as the sole specificity trigger. The clitic is argued to function as a function restricting the output of the embedding functions interpreting the respective marked indefinite in DRT terms.
[5] See Tigău (2016) for an initial discussion on the behaviour of marked and unmarked DOs within these contexts.

d.   **(*I)**-am   văzut   câțiva   studenți   învăţând
      CL.3.PL.ACC-have.I   seen   some   students   studying
      'I saw some students studying.'

As pointed out in the previous section, Romanian DOM has been claimed to function as a specificity trigger. Dobrovie-Sorin (1994) observes that the use of *pe* in (6b) disambiguates between the readings that the indefinite DP may engender towards a specific one.

(6)   a.   Caut   o   secretară
            Look.I.   a   secretary
            'I am looking for a secretary.'   Dobrovie-Sorin (1994): (48a) p. 224

      b.   Caut   **pe**   o   secretară
            Look.I.   DOM   a   secretary
            'I am looking for a secretary.'   Dobrovie-Sorin (1994): (61a) p. 234

Cornilescu (2000) makes a similar observation, arguing that DOM, i.e., the *pe*-marked DO in (7), is interpreted as epistemically specific:

(7)   ...unde   să   vizitez   **pe**   niște   vechi   şi   buni prieteni
        where   SUBJ.   visit   DOM   some   old   and   good friends
        '... where I should visit some good old friends.'
                                                    Cornilescu (2000): (30) p. 102

Hill and Tasmowski (2008) also observe that the use of DOM in (8) induces a reading according to which the referent denoted by the marked DO is to be understood as part of a background set. No such presupposition seems to be available in the absence of DOM:

(8)   Am   văzut   **(pe)**   mulți colegi   pierzându-şi   capul
      Have.I   seen   DOM   many colleagues   losing-REFL   head.the

   în momente   de criză
   in moments   of crisis
   'I've seen many colleagues of mine losing their head in moments of crisis.'

                                  Hill and Tasmowski (2008): (5d) p. 142-143

Examples (6), (7) and (8) show that there are different kinds of specificity, namely, scopal, epistemic and partitive specificity, respectively (see Farkas and Brasoveanu (to appear) for a discussion). What types of specificity there are and whether they can be unified under one general notion or function is still controversial (see von Heusinger 2002, 2019 for an extensive overview). We can, however, state that DOM is triggered by specificity in various languages (Aissen 2003). In Spanish, DOM is realized by the marker *a*, which is derived and homophonous to the dative marker and the preposition for *to*. In Spanish, unmarked indirect

objects are non-specific, while DOM-marked ones are either specific or non-specific, see (9) (e.g. López 2012: 1-2). Non-specificity is triggered by the subjunctive in the relative clause.

(9) a.
María	buscó	**a**/Ø	una	gestora	que	hablara	alemán
Maria	looked for	*DOM/Ø*	a	manager	that	spoke.SUBJ	German

b.
María	buscó	**a**/*Ø	una	gestora	que	hablaba	alemán
Maria	looked for	*DOM/Ø*	a	manager	that	spoke.IND	German

Turkish expresses DOM with a suffixed case marker *(y)i* (and its vowel-harmonic allophones *(y)ı, (y)u, (y)ü))*. It is generally assumed that case-marked DOs are always specific while unmarked DOs are non-specific (10) (von Heusinger & Kornfilt 2005).

(10) a
(ben)	**bir** *kitap*	oku-du-m		*indef. non-specific*
I	**a** book	read-PAST-1.SG		

'I read **a** book.'

a
(ben)	**bir** *kitab-ı*	oku-du-m		*indef. specific*
I	**a** book-**ACC**	read-PAST-1.SG		

'I read **a certain** book.'

Turkish seems to be different from Spanish and Romanian in that the case marker clearly expresses (scopal) specificity[6]. Spanish is different from Romanian in that, while the case marker allows for a specific and non-specific reading, unmarked DOs seem to always read non-specifically. In Romanian, on the other hand, the non-marked form is unspecified for specificity. DOMed DOs behave on a par with their Spanish counterparts, allowing both for a specific as well as for a non-specific interpretation.

The case of Romanian DOs seems to be more complex in this respect, given that CD has also been claimed to trigger specificity and, as already expanded upon above, there are cases where the specific reading obtains in the absence of DOM (e.g., CLLDed inanimate DOs) along with cases where DOMed DOs lose their specific interpretation while their DOMed+CDed counterparts seem to be able to retain it (e.g., the examples where the marked DO co-occurs with negation in (2)).

The experiment we conducted aimed at investigating this difference in behaviour with respect to specificity between DOMed DOs and CDed+DOM DOs under the expectation that the former DOs would exhibit loss of the specific reading within appropriate contexts, while the latter would still retain their specific interpretation.

3. Non-specific contexts

By non-specific contexts we mean those contexts which force a non-specific interpretation on the direct object DP. In this paper we discuss contexts featuring the following expressions: *cel mult* ('at most')/*cel puțin* ('at least'), the distributive *câte*, the free choice indefinite

---

[6] Krause & von Heusinger (2019) have analysed acceptability data suggesting that this only holds for scopal specificity and not for epistemic specificity.

oarecare ('any'), relative clauses modifying the indefinite DO and containing a predicate in the *subjunctive mood*.

3.1 Quantifiers *mult (at most)/cel puțin (at least)*

One context forcing a non-specific interpretation on the indefinite direct object is that in which the DO is preceded by the quantifiers *cel mult* ('at most')/*cel puțin* ('at least'): In (11a), the unmarked indefinite DO may allow both for a non-specific interpretation and a specific one. Under the former reading, the set of two colleagues whom Michael helps may vary from one evening to the next. Under the specific reading, Michael helps the same two colleagues every evening.

When the indefinite is, however, preceded by *cel mult,* as in (11b), the only available interpretation for the DO is the non-specific one. It seems then that the *cel mult/cel puțin* phrase disambiguates between the two possible interpretations in favour of the non-specific one and thus creates an optimal testing ground of whether or not an expression is specific.

(11)   a.   Mihai   ajută   doi colegi   la teme   în fiecare zi
           Michael   helps   two colleagues   at homework   in every day
           'Michael helps two colleagues with their homework every day.'

   b.   Mihai   ajută   *cel mult*   doi colegi   la teme   în fiecare zi
       Michael   helps   at most   two colleagues   at homework   in every day
       'Michael helps at most two colleagues with their homework every evening.'

Such a non-specific context will allow us to find out which of the two mechanisms triggers specificity. Example (12) contains the three versions of a test item tested in the experiment presented in section 4 below. The three variants differ with respect to marking: (a) contains an unmarked DO, (b) contains a DOMed DO, while (c) exhibits a CDed+DOMed DO:

(12) Context: În apropierea alegerilor toate canalele de televiziune organizează dezbateri politice oferind astfel telespectatorilor șansa de a decide în cunoștință de cauză cu cine votează.
'On the eve of elections, all TV channels organise political debates enabling the viewers to make an informed choice as to who they will vote for.'

a.   Realizatorii   acestor   emisiuni   pot,   însă,   invita   *cel mult*
    Producers.DEF.ART.   these.GEN   shows   may   however   invite   at most

doi candidați   la președinție   altfel   riscă   să   depășească   limita de timp
two candidates   at presidency   otherwise   risk   SUBJ   surpass   limit of time
'The producers of these shows may, however, only invite at most two candidates otherwise they risk running out of time.'

b.   Realizatorii   acestor   emisiuni   pot,   însă,   invita   **pe**   *cel mult*
    Producers.the   these.GEN   shows   may   however   invite   DOM   at most

doi candidați	la președinție	altfel	riscă	să	depășească	limita de timp
two candidates	at presidency	otherwise	risk	SUBJ	surpass	limit of time

'The producers of these shows may, however, only invite at most two candidates otherwise they risk running out of time.'

c.	Realizatorii	acestor	emisiuni	**îi**	pot,	însă,	invita
	Producers.DEF.ART.	these.GEN	shows	CL.3.PL.ACC	may	however	invite

pe	*cel mult*	doi candidați	la președinție	altfel	riscă	să
DOM	at most	two candidates	at presidency	otherwise	risk	SUBJ

depășească	limita de timp.
surpass	limit of time

'The producers of these shows may, however, only invite at most two candidates otherwise they risk running out of time.'

3.2. Distributive *câte*

Another context that we verified experimentally is that built around the distributive determiner *câte*. As argued in Farkas (2001), this determiner restricts the possible interpretations of an indefinite to a non-specific and a narrow scope one. Hence, while both a specific and a non-specific interpretation are available for the indefinite DO *un coleg* ('a colleague') in (13a) as shown by the specific continuation (i) and the non-specific on (ii), the presence of *câte* restricts the possible readings to the non-specific one (hence the ungrammaticality of (b.i.)):

(13) Context: Șeful de departament se alege prin vot secret.
        'The head of the department is elected by resorting to secret voting.'

a.	Ieri,	membrii departamentului	au	ales	un	coleg
	Yesterday	members.the department.GEN	have	chosen	a	colleague

de pe lista	de candidați
on list.the	of candidates

'Yesterday, the members of the department have all selected a colleague from the list of candidates.'

i. Acesta a fost domnul Popescu.
 'This was Mr. Popescu.'
ii. Dar nici unul dintre cei selectați nu a reușit să obțină majoritatea din primul tur.
  'But none of those selected managed to obtain the majority of votes in the first round.'

b.	Ieri,	membrii	departamentului	au	ales	**câte**	un
	Yesterday	members.the	department.GEN	have	chosen	CATE	a

coleg   de pe lista   de candidați
colleague   on list.the   of candidates
'Yesterday, the members of the department all selected a colleague from the list of candidates.'

i. *?Acesta a fost domnul Popescu.
   'This was Mr. Popescu.'
ii. Dar nici unul dintre cei selectați nu a reușit să obțină majoritatea din primul tur.
   'But none of those selected managed to obtain the majority of votes in the first round.'

A sample item from the experiment may be found in (14) below, with its three variants:

(14) Context: Pacienților trebuie să le fie respectate demnitatea și dreptul la intimitate pe toată durata consultației.
'One must respect the dignity and right to privacy of patients during the examination.'

a. Ca urmare,   doctorul   poate   examina   numai   *câte*   un
    As consequence,   doctor.the   may   examine   only   CATE   a

pacient   pe rând
patient   in turn
'As a consequence, the doctor may examine only one patient at a time.'

b. Ca urmare,   doctorul   poate   examina   numai   **pe**   *câte*
    As consequence,   doctor.the   may   examine   only   DOM   CATE

un   pacient   pe rând
a   patient   in turn
'As a consequence, the doctor may examine only one patient at a time.'

c. Ca urmare,   doctorul   **îl**   poate   examina
    As consequence,   doctor.DEF.ART   CL.3.SG.M.ACC   may   examine

numai   **pe**   *câte*   un   pacient   pe rând
only   DOM   CATE   a   patient   in turn
'As a consequence, the doctor may examine only one patient at a time.'

3.3 Free choice indefinite *oarecare* ('any')

Another context tested in the experiment was the one provided by the free choice indefinite *oarecare* ('any'). Just as with the previous two contexts, we expected indefinites preceded by *oarecare* to lose their, otherwise possible, specific interpretation. Under the hypothesis according to which DOM and CD trigger a specific reading, CDed+DOMed DOs were expected to be rejected within the context of *oarecare*, while DOMed DOs would turn out as good as unmarked DOs. Example (15) shows this at work: the unmarked DO allows for a specific or non-specific reading: Maria may be looking for a specific (or non-specific)

mechanic who might help her with the car. When the DO carries the modification of *oarecare,* the specific reading is ruled out.

(15) Maria   caută   un   mecanic   (*oarecare*)   pentru niște reparații   la mașină
Mary   seeks   a   mechanic   any   for   some repairs   at car
'Mary is looking for a mechanic for some repair work on her car.'

The free choice indefinite *oarecare* may be combined with a modifying relative clause containing a predicate in the subjunctive/indicative: (16a) shows that the co-occurrence of the indefinite DO preceded by *oarecare* with a relative clause in the subjunctive restricts the available readings of the DO to a non-specific one; (16b) shows that co-occurrence of *oarecare* and the indicative mood in the modifying relative causes a clash:

(16)   a.   Caut   o   secretară   oarecare   care   să   vorbească   englezește
Look.I   a   secretary   any   who   SUBJ.   speak   English
'I am looking for a (any) secretary who might speak English.'

b.   ?Caut   o   secretară   oarecare   care   a   vorbit   englezește
Look.I   a   secretary   any   who   has.IND   speak   English
'I am looking for a (any) secretary who has spoken English.'

Consider also (17), containing an actual sample item we tested in the experiment:

(17) Context: Înainte de fiecare teză profesorul le dă elevilor lista cu referințele bibliogafice.
'Before each test paper the teacher gives the students a list of references.'

a.   Aceștia   selectează   apoi   trei   autori   oarecare   și   studiază   în
These   select   then   three   authors   any   and   study   in

profunzime   întreaga   lor   operă
deep   all   their   work
'These select three authors from the list and study their work thoroughly.'

b.   Aceștia   selectează   apoi   **pe**   trei   autori   oarecare   și   studiază
These   select   then   DOM   three   authors   any   and   study

în   profunzime   întreaga   lor   operă
in   deep   all   their   work
'These select three authors from the list and study their work thoroughly.'

c.   Aceștia   **îi**   selectează   apoi   **pe**   trei   autori   oarecare
These   CL.3.SG.PL.M.ACC   select   then   DOM   three   authors   any

și   studiază   în   profunzime   întreaga   lor   operă
and   study   in   deep   all   their   work
'These select three authors from the list and study their work thoroughly.'

10

3.4 Relative clauses containing a predicate in the *subjunctive mood*

Mood has also been argued to influence the specific/non-specific interpretation of indefinite DOs. As pointed out by Rivero (1979) and Farkas (1987), the grammatical mood of a predicate from within a relative clause modifying a nominal functions as a specificity test. The examples under (18) show this at work: the unmodified DO in (18a) may evince both a specific as well as a non-specific interpretation; in (b), on the other hand, where the indefinite DO has been modified by means of a relative clause whose predicate is in the subjunctive, the only possible reading is the non-specific one. In (c), where the mood in the relative clause is the indicative, the DO may only read specifically:

(18)   a.   Maria   caută   un   mecanic
            Mary   seeks   a   mechanic
            'Mary is looking for a mechanic.'

   b.   Maria   caută   un   mecanic   care   să   îi   repare   mașina
        Mary   seeks   a   mechanic   who   SUBJ   CL.3.SG.DAT   repair   car.the
        'Mary is looking for a mechanic who should repair her car.'

   c.   Maria   caută   un   mecanic   care   i-a   reparat   mașina
        Mary   seeks   a   mechanic   who   CL.3.SG.DAT-has   repaired   car.the
        'Mary is looking for a mechanic who repaired her car.'

Just as it happens with DOs preceded by *cel mult/cel puțin* ('at most'/'at least'), we expect CDed+DOMed indefinites to be infelicitous when modified by a relative clause containing a predicate in the subjunctive, while DOMed indefinites should be as good as unmarked ones when modified by such a relative clause. Example (19) shows the three variants of a sample we tested in the experiment. Note that only the case of indefinite DOs modified by relatives with predicates in the subjunctive was considered in the experiment:

(19) Context: Secretara departamentului tocmai s-a pensionat, iar directorul ar avea nevoie de cineva mult mai bine pregătit.
'The secretary of the department has just retired and the manager would need someone with a much better expertise.'

   a.   El   va   aprecia   cu siguranță   o   secretară   care   să   poată
        He   will   appreciate   with certainty   a   secretary   who   SUBJ   can

vorbi   fluent   două   limbi   străine
speak   fluently   two   languages   foreign
'He will definitely appreciate a secretary who can fluently speak two foreign languages.'

   b.   El   va   aprecia   cu siguranță   **pe**   o   secretară   care   să   poată
        He   will   appreciate   with certainty   DOM   a   secretary   who   SUBJ   can

vorbi   fluent   două   limbi   străine
speak   fluently   two   languages   foreign
'He will definitely appreciate a secretary who can fluently speak two foreign languages.'

c. El **o**   va   aprecia   cu siguranță   **pe**   o   secretară
    He CL.3.SG.F.ACC will appreciate with certainty DOM a secretary

care   să   poată vorbi fluent   două   limbi   străine
who   SUBJ.   can   speak fluently two   languages   foreign
'He will definitely appreciate a secretary who can fluently speak two foreign languages.'

As already pointed out, the expectations for the four contexts were for them to allow the use of unmarked indefinite and DOMed DOs (on a non-specific interpretation) and to disallow CDed+DOMed indefinites, given that CD is hypothesised to trigger specificity.

4. The Experiment

4.1 Hypotheses

As already pointed out, our expectations with respect to the present experiment had been formed from various studies on Romanian DOM and CD, which analyse both these mechanisms as specificity triggers[7] and which distinguish marked DOs from their unmarked correspondents, whose interpretation may vary between a specific and a non-specific one. As a consequence, we expected unmarked indefinite DOs to fare well in the four contexts inducing a non-specific interpretation where they are expected to read non-specifically.

Building on Tigău (2016), who argues that DOMed indefinite DOs behave similarly to their unmarked counterparts in these contexts, we expected these DPs to also fare well in these contexts and to lose their specific interpretation (which seems to be preferred otherwise, as argued in Cornilescu 2000, a.o.). CDed+DOMed indefinites, on the other hand, were expected to be totally discarded from such contexts, given that they seem to retain their specific interpretation irrespective of the contexts they occur in (see ex. (2) and (4) above).

The following hypotheses were thus posited for our experiment:

H1:   Unmarked DOs may read both specifically as well as non-specifically and the latter reading obtains easily in contexts inducing a non-specific interpretation.
H2:   DOMed DOs pattern with unmarked DOs allowing for a non-specific reading in the appropriate contexts
H3:   CDed+DOMed DOs strongly favour a specific interpretation and will be discarded as ungrammatical when inserted in contexts forcing a non-specific reading.

4.2 Design and procedure

The experiment checked the behaviour of unmarked, DOMed and CDed+DOMed indefinite DOs within the four contexts described above. Table 1 shows the contexts together with the corresponding predictions.

Context / Indefinite	cel mult (at most)/cel puțin (at least)	câte	oarecare (any)	subjunctive
a) unmarked DO	✓	✓	✓	✓
b) DOMed DO	✓	✓	✓	✓
c) CDed+DOMed DO	✗	✗	✗	✗

Table 1: Non-specific contexts and predictions for types of indefinite DOs

For each of the four contexts, we designed 9 sentences (36 different lexicalisations in total), which we further varied according to the function of DO type (unmarked DO vs. DOMed DO vs. CDed+DOMed DO). We thus ended up having 108 items, 9 for each of the cells in Table 1.

We employed 18 filler items, of which 6 were proper control items and the other 12 belonged to a pilot test of the interaction of CD and binding of arguments. They had been previously tested informally with a small group of respondents who did not take part in the main experiment. Control items 1-6 contain verbs which may only select a CDed Dative object, which were presented in three different forms, as illustrated in (20). In (20a), the dative object is a proper name and is clitic-doubled, in (20b), the dative object is a quantifier phrase (QP) and is also clitic-doubled. Both constructions are expected to be rated as very good. (20c) contains a proper name but no clitic, a clearly ungrammatical construction – therefore we expected a very bad rating in this case.

(20) a. **Mariei**   **i**   s-a   aplecat   de la salata de vinete
         Mary.DAT   CL.3.SG.DAT   REFL-has   got sick   from salad of egg plants
         'Mary got sick from the egg plant salad.'

  b. **Oricui**   **i**   s-ar fi   aplecat   de la salata de vinete
         Anyone.DAT   CL.3.SG.DAT   REFL-would be   got sick   from salad of egg plants
         'Anyone would have gotten sick from that egg plant salad.'

  c. **Mariei**   s-a   aplecat   de la salata de vinete
         Mary.DAT   REFL-has   got sick   from salad of egg plants
         'Mary got sick from the egg plant salad.'

Filler items 7-18 were good grammatical constructions, but difficult to process – so we expected good ratings, but lower than the very good ones from the good control items. Fillers 7-18 contain verbs which require a dative object. We had three variants as illustrated in (21): (21a) contains a CDed dative object which is bound by the subject QP; (21b) contains an undoubled dative object and the same quantificational binding relation as in (21a); variant (21c) contains a clitic-doubled dative object which is now bound by a proper name:

(21) a. **Orice elev**_i silitor *îi* place **profesorului său**_i
Any pupil hardworking CL.3.SG.DAT pleases professor.DAT his
'Any hardworking pupil pleases his teacher.'

b. **Orice elev**_i silitor place **profesorului său**_i
Any pupil hardworking pleases professor.DAT his
'Any hardworking pupil pleases his teacher.'

c. **Petre**_i *îi* place **profesorului său**_i
Any pupil CL.3.SG.DAT pleases professor.DAT his
'His teacher likes Peter.'

All 18 filler items were distributed **into 3 different lists** using the Latin square method for an even distribution and were merged with the 36 test items, such that each of the three lists had 54 items in total.

The questionnaires were formatted as Google online forms in such a way that the potential respondent could only access one item at a time, without having the possibility of going back or forth. Each questionnaire was assessed by at least 20 native speakers of Romanian, with a total of 67 people taking part in the experiment. Respondents were required to assess each item on an acceptability scale ranging from 1 to 7, where 1 was listed as *completely unacceptable,* while 7 was labelled as *completely acceptable.* The respondents who failed to assess the control items in an appropriate way were discarded as outliers. We had 20 remaining participants for each of the questionnaires – their judgements entered statistical analysis.

4.3 Results

The main results of the questionnaires are summarized in Figure 1, which shows the mean value of the acceptability judgements for each of the four contexts and each of the three forms:

Figure 1: Mean values of accessibility judgemens for contexts and DO types

The results clearly show that unmarked indefinite direct objects in the non-specific contexts are always rated well. This confirms hypothesis 1. However, the results also show that DOMed direct objects are rated somewhat worse than CDed DOMed direct objects. This goes against hypotheses 2 and 3, where we predicted that DOMed direct objects pattern with unmarked DOs, while DOMed and CD direct objects are clearly specific and expected to be rated badly in this context.

We also see that all four contexts show very similar results, i.e., the three DO types behave similarly irrespective of the context in which they occur. Statistic analysis (see appendix) shows that there is no effect between contexts. We will therefore merge the contexts in the subsequent discussion. There is a clear effect between unmarked direct objects and DOMed direct objects and DOMed CD direct objects. There is also a significant contrast between DOMed and CDed DOMed direct objects.

As already pointed out, marked DOs, whether DOMed or CDed+DOMed, received significantly worse acceptability scores than initially predicted, a result which one might expect under a hypothesis that DOM and CD are specificity triggers. What is, however, unexpected is that the variants containing DOMed or CDed+DOMed DOs were not completely discarded as unacceptable, but actually assigned scores which ranged towards the mid area of the acceptability scale. Figure 2 shows, for instance, that the results obtained for marked DOs are higher than the acceptability threshold of 3.5 GM on the scale for all the four contexts, and more closely to the rating of the good items (4,69) than of that of the bad items (1,77).

Figure 2: Mean values of acceptability judgements for DO type in all contexts and control items

Further inspection of the data reveals that we have a very broad variance of the judgements for both the CDed+DOMeD direct objects and the DOMed direct objects from nearly unacceptable to clearly acceptable. See Figure 3 for the distribution of judgements for DOMed DOs and CDed DOMed DOs. It becomes obvious that there are speakers who do not accept these constructions at all, while others do judge them as good as unmarked direct objects. Figure 3 represents the informants according to their judgements on the DOMed DO construction, it also indicates that the judgements for CDed DOMed direct objects are very close to the judgements for DOMed direct objects, with minor variation, in particular in the lower ratings.
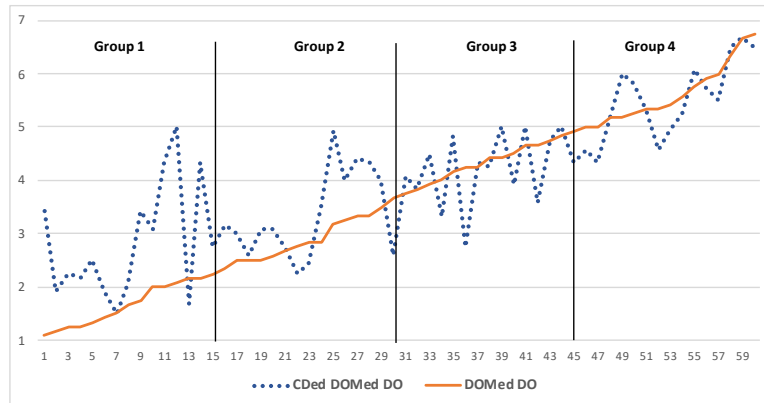

Figure 3: Distribution of informants according to judgements for DOMed DOs.

We see that there is a very homogenous distribution over the whole scale. We therefere divided all informants into four groups according to their judgements of the DOMed DOs: Group 1 discarded DOMed direct objects in non-specific contexts, while group 4 judged them to be almost as good as unmarked direct objects.

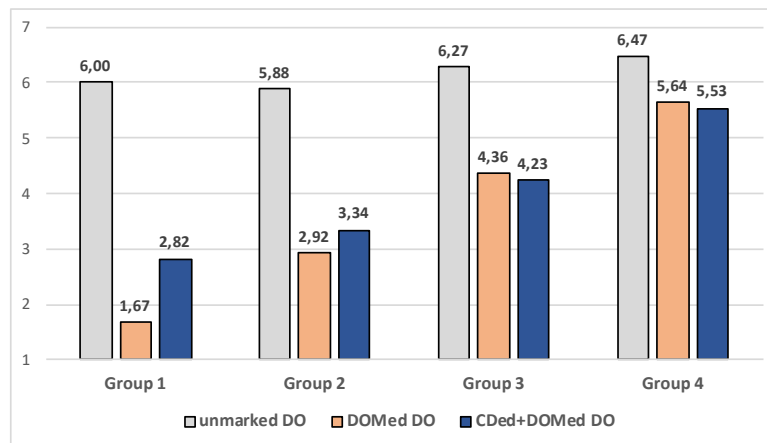

Figure 4: Acceptability judgements for type of direct object and Group 1–4.

Figure 4 shows that all groups rate the unmarked directs objects in the non-specific contexts very highly. They differ in the acceptability of the two marked versions. For Group 3 and 4, they rate both marked versions very highly and we do not see any difference in acceptability, while for Group 1 we see that CDed+DOMed variants are somewhat better rated than the DOMed version. For Group 1, the difference between DOMed DO and CDed+DOMed DO is even significant, while this is not the case for the other groups

If we analyse the results of Group 1 in more detail, as illustrated in Figure 5, we see that the acceptability varies with the context: For DOMed DOs all contexts are similarly bad, while for CD+DOMed DOs we see that the contexts with *câte* is very bad, while the one containing the quantifiers *cel mult/cel puțin* are much better rated. The *oarecare* and

subjunctive mood contexts are in between. These judgements within Group 1 confirm the observations of an anonymous reviewer.[8]

Figure 5: Acceptability judgements for Group 1 for the 4 different contexts and DO types

A reviewer suggested that the differences between the different groups may also depend on age, as they reflect the diachronic development from fewer contexts that allow DOMed DOs without CD to more contexts where the lack of CD is allowed. In order to test this hypothesis, we divided all participants into two groups according to age, the young (under 30, 40 participants) and old (over 29, 20 participants) and looked at the distribution of the young and the old over Groups 1 to 4. We could find more older participants in Group 1 and 2 and less in Group 3 and 4, as summarized in Table 2.

	Group 1	Group 2	Group 3	Group 4	all
old	25% (5)	55% (11)	15% (3)	5% (1)	100% (20)
young	25% (10)	10% (4)	30% (12)	35% (14)	100% (40)

Table 2: Distribution of older vs. younger informants across groups

This result is further substantiated by findings from diachronic investigations on the evolution of DOM and CD in Romanian (see von Heusinger and Onea 2008 for an overview). More specifically, Lindemann (2017) shows in a corpus search that about 97% of animate DOs are DOMed and CDed in present-day Romanian, while DOMed constructions without CD are licenced only in particular syntactic/semantic contexts (comparative constructions, verbs that require certain prepositions, etc.). From 1900–1950 and earlier, however, less than 50% of speakers used CD and DOM together and non-CDed DOMed DOs seem to have been the norm. This corpus search correlates with the variation observed in the grammaticality judgement task reported above.

---

[8] The reviewer reports: "For me, there is a difference in the acceptability of the test items given to the participants also based on the sentence. The c) condition [i.e., CDed DOMed DOs] seems to be more readily compatible with the *subjunctive & oarecare* and less so with *cel mult/puțin*. The only context I would definitely rule out c is with *câte*."

5. General discussion

Given the experimental results presented, we need to discuss the following aspects against the background of our initial hypotheses: 1. Unmarked indefinite DOs obtain high acceptability scores, which confirms our hypothesis. 2. DOMed DOs receive the lowest acceptability scores, contrary to our expectations. These results need to be confronted with our initial hypothesis according to which DOMed DOs should pattern with unmarked DOs in allowing occurrence within the four contexts under a non-specific reading. 3. CD+DOMed variants get high scores, contrary to our initial hypothesis that these DOs would be completely discarded from the four contexts. 4. An explanation as to why the CDed+DOMed variants fared better than their DOMed counterparts is also necessary, in particular in contexts where both types are not accepted (Group 1 and Group 2).

The high acceptability scores assigned to items containing unmarked DOs are expected, given that these DPs generally allow both a specific and a non-specific reading and may acquire both a wide scope and a narrow scope interpretation when co-occurring with other scope-taking expressions. When used in the four contexts inducing a non-specific interpretation, the unmarked DOs will thus lose their (otherwise available) specific interpretation and read non-specifically.

When it comes to accounting for the **unexpectedly low acceptability of DOMed DOs**, several aspects need to be considered. First, we have to note that we find a very high variation in responses and that it seems that acceptability depends on different speaker groups. We focus on those groups that do not accept this type of direct object. Here we find a clear contrast between DOMed DOs and CDed DOMed DOs – see Fig. 4 Group 1 and 2.

Consider first our initial research hypothesis according to which DOMed DOs should fare similarly to their unmarked counterparts in the four tested contexts: Tigău (2016) discusses specificity with DOMed indefinite DOs and reaches the conclusion that DOM is not a specificity trigger. She points out that there are situations where a differentially marked DO does not read specifically. In (22), for instance, DOM is obligatorily required with the bare quantifier *nimeni* ('nobody'), which is never specific:

(22) Nu am   văzut   pe/*∅   nimeni   pentru că   era   întuneric
     Not have.1.SG. seen   DOM/*∅   nobody   because   was   dark
     'I didn't see anyone because it was dark.'

Recall also the examples under (2) where the DOMed indefinite may only be interpreted in the scope of the negative operator. In this respect, the DOMed DO (a) patterns with its unmarked counterpart; the CDed+DOMed variant (b) is however discarded from such a context, which was expected, given that such DPs are thought to always read specifically and, as such, to outscope the negative operator, a reading which, however, the context does not allow, hence the impossibility of CD+DOM.

The examples above thus show that the non-specific interpretation remains an option with DOMed indefinite DOs and that it may actually be actualised in an appropriate context. Hence the expectation that DOMed DOs behave similarly to their unmarked counterparts within the four tested contexts forcing a non-specific reading.

When confronted with examples such as the ones above, where DOMed DOs seem to be able to lose their specific reading within appropriate contexts, we expected to witness

a similar behaviour within the four tested contexts. Consequently, the unexpected lower acceptability scores with these DOs for Group 1 and 2 needs an explanation. An initial step towards finding an answer in this respect would be to consider some similar results reported in Avram (2014). The experiment presented by Avram involves two acceptability questionnaires filled in by 23 native speakers of Romanian, which seem to fall into two groups: speakers who always clitic-double the DOMed DO and speakers who allow both for a 'single' DOMed variant and a CD+DOM one. It seems that for some respondents the single DOM variant is simply unacceptable: They seem to always pair CD with DOM and to consider this combination the only one available for DO marking. To these respondents, CD+DOM seems to have functional unity (see also Tigău 2015 for a similar proposal).

A similar propensity to mark DOMed DOs as less acceptable than their CDed+DOMed counterparts was noticed in another experiment carried out by Tigău and von Heusinger (2019) on testing binding within ditransitives. A general observation made with respect to those instances where DOMed DOs are employed is that these DPs tend to fare worse than the items where CDed+DOMed counterparts are used. Thus, while items containing DOMed DOs never get scores higher than 4.43 on a seven-rung Likert scale, sentences containing CDed+DOMed DOs may reach acceptability values of 5.52.

Given the experimental results obtained independently of our own undertaking, which show a general dispreference for DOMed DOs in the absence of CD, we might consider that a possible explanation of the low acceptability results in Group 1 and 2 would actually have to do less with their potential for a specific reading or for the loss of that reading in the four tested contexts, and more with the general apprehension concerning the phenomenonon of DOM marking (without CD) as such.

The unexpected high acceptability of CDed+DOMed DOs is more expressed in Group 3 and 4, but is also obvious in Group 1 and 2 in Figure 4. Our initial hypothesis with respect to CDed+DOMed indefinite DOs was that these DPs would be disallowed from contexts inducing a non-specific interpretation. Data regarding the behaviour of inanimate CLLDed DOs which do not need DOM and which seemed to disallow non-specific readings and to be rejected from contexts forcing such a reading on them supported this hypothesis.

Nevertheless, this expectation was disconfirmed since the respective items generally received scores ranging around the mid area of the acceptability scale, which showed that they were considered not altogether unacceptable, but rather acceptable. The explanation we would like to propose follows the line of argument advanced for DOMed DOs and takes CD+DOM as a complex mechanism where the combination of DOM and CD exhibits a functional unity. The pronominal clitic seems to be less of a specificity trigger and to actually have a syntactic role, most probably triggering movement of the marked DO out of the VP into a position where the DO has access to a mode of semantic composition (i.e., choice functions) which may give rise to a specific interpretation along the lines of López (2012)[9]. Having a specific interpretation is, however, not mandatory (as is also the case with DOMed indefinite DOs.).

Thus, in line with López (2012)'s proposal for Spanish marked DOs, the specific interpretation is not linked with a piece of morphology, i.e., the pronominal clitic, but comes about as a result of a peculiar mode of semantic composition enabled in syntax by way of

---

[9] This is position P3 in López (2012), a position within the TP area, wherefrom the scrambled DO may bind into the subject DP, for instance.

movement to an appropriate position. This is in turn related to the argument status of the marked DO – as pointed out by López (2012), marked DOs lose the <e,t> reading available for their unmarked counterparts and acquire argument status (see also Bleam 2005). As such, marked DOs may no longer check case by way of incorporation into V (as seems to be possible for unmarked variants), but have to move out of VP in order to do so. The position they reach renders available a special mode of semantic composition (through choice functions), which enables a specific reading for the respective DP (Onea and Hole 2017, Tigău in press).

Given the considerations above, CDed+DOMed DOs may actually lose their specific interpretation in the appropriate contexts as is the case with the four tested contexts discussed in this paper. Furthermore, given the functional CD+DOM unit formed, CDed+DOMed DOs should actually be expected to fare better than their DOMed counterparts, just as the experimental results show.

6. Conclusion

The experiment presented in this paper has unveiled a few interesting facts with respect to the behaviour of Romanian marked and unmarked indefinite DOs within contexts forcing a non-specific interpretation. The following conclusions were reached: All respondents assign high acceptability scores to unmarked indefinite DOs occurring within contexts forcing a non-specific interpretation. This is to be expected, given that unmarked indefinites freely allow both a specific and a non-specific interpretation.

DOMed indefinite DOs and their CDed+DOMed counterparts fare significantly worse in the tested contexts, but they are not totally discarded, when compared to the *bad* fillers, which get very low acceptability scores. Moreover, they show a stable variation that allows us to assume that we are faced with different speaker groups with different uses of these constructions. Some speakers (Group 3 and 4) accept both constructions in the non-specific contexts, thus neutralising a possible function of CD and DOM in expressing specificity. For these speakers we have to assume a different function of CD and DOM. Other speaker groups, (Group 1 and 2) do not accept these constructions in non-specific contexts. Here we can conclude that CD and DOM do express specificity which then would lead to the unacceptability in non-specific contexts. Our data also suggests that it is DOM that expresses specificity, while the function of CD cannot be identified through this type of questionnaire. Another possible explanation for the low acceptability of single DOMed variants in Group 1 and 2 may have to do with the general constraint against using DOM in the absence of CD, given the functional unity that DOM and CD seem to have reached.

The fact that marked DOs seem to fare well in non-specific contexts for many of the respondents and that this tendency seems to be on the increasing trend suggests that we are witnessing a diachronic development of the function of CD and DOM from a marker of specificity towards a marker of true argumenthood of the direct object DP. This, in turn, provides support to the hypothesis that DOM and CD have a syntactic role contributing to the general layout of the direct object DP and thereby triggering some special mechanisms of case assignment (i.e., blocking inherent case assignment and movement out of VP to a functional position).

Appendix: DOs in contexts inducing non-specificity

Statistical analyses were conducted in R version 1.0.136 using the lme4 package (Bates et al., 2015) to perform linear mixed-effect models (LMEM) with the score as outcome variable. As fixed effects, we entered context and DO type into the model. As random effects, we had intercepts for subjects and items. The context *cel mult/cel puțin* and DO type *unmarked DO* were mapped onto the intercept. To identify the best model fit we performed likelihood ratio tests. This revealed that the reduced model with two main effects affected the acceptance rate (χ^2 (4) = 6.34, p > .05).[10]

	Estimate	Std. Error	t value
Intercept	6.2884	0.1804	34.86*
